

H4 Euro Bulb Adaptor Lead - To Yamaha Wiring Loom

Skill rating: 

The above diagram shows how to connect Yamaha XT wiring to the H4 bulb holder in our kit that has standard European wire colours. Simply connect the bike's wiring to the new holder, matching up the colours as shown.

Pilot Lamp

Many models are not fitted with a pilot lamp. There are only two wires, often these are light blue and black. Some models may have different colours, note it does not matter which way round these go.

Adding the wiring for the pilot light where none was fitted

If there was no pilot light and you want to wire one in, you must modify the wiring to accommodate this. Generally the best approach is to hook in to the 5 watt taillamp circuit. An alternative would be to tap in to the instrument lights. You will need to be in possession of the shop manual with the wiring diagram to help you. This is a job for an experienced expert.

All connections should be made with Japanese type motorcycle bullet connections. Ensuring the lighting complies with your Countries lighting laws is the responsibility of the person fitting these parts and doing the work.
